In September 2015, the company reported revenues of US$1.27 billion, including $0.73 in net income on a GAAP basis.[9] They reported approximately 3.8 million AutoCAD users in 2015.[10] The company has 11 offices in eight countries, and its headquarters is located in San Rafael, California, United States. AutoCAD is a 2D drafting application. The primary functionality of AutoCAD is to render 3D drawings. CAD is used for 2D drawings and drafting. This drawing process consists of a series of commands to specify what is to be done (modify existing elements), where the elements are to be placed (move or copy), how they are to be arranged (snap to grid, snap to object), and what the basic color is (fill, line, line-color, etc.). A typical drawing for AutoCAD starts with the most generic element—the block—which is similar to a page in a graphic or poster. This is a template or drawing canvas in which an object is created. Any subsequent drawings are based on this starting template. A block is an element that can be located anywhere on a page, and includes, for example, tables, blocks of text, shapes, lines, arcs, bezier curves, polygons, and 3D solids. Blocks can be combined to create objects such as doors, windows, and walls. Each block has a number of attributes that describe its properties. For example, the type of block (e.g. rectangle), its dimensions, and its color. The user may modify the shape and location of a block, and assign the attributes that define the block. These modified blocks are then used as components to create more complex objects. To create a complex drawing, it is possible to select various components and arrange them to form a complete drawing. To do this, a user typically selects an object and clicks it to select it for editing. Once an object is selected, a context menu allows the user to change the attributes of the object. A block is typically a polygon or line with attributes like thickness, color, line-type, and others. A context menu allows the user to change the attributes of the selected object, using attributes such as dimensions and line types. For example, after selecting the start point of an arc, it is possible to change its dimensions, line type, start and end angle, and others. A single object can have multiple

It supports the ability to create and edit vector graphics, including geometric shapes (such as lines, curves, arcs, circles, ellipses), splines, text, and shapes. In addition to its native vector graphics capabilities, AutoCAD supports importing of many other file formats, including, among others: This refers to an AutoCAD entity or entity. Elevation Embedded View Raster Graphic Raster Rasterisation Interactive Drawing Interactive drawing is a feature which has been missing in previous versions of AutoCAD. It allows the user to interact with the model as if it were a physical object. This feature is only available in AutoCAD LT. A dynamic object is a type of object which may be updated after its creation. In this context, it is a type of entity which contains the attributes of a real-world object. Q: How to create jquery function to change the image at a time intervals I want to change the image at a time intervals. I have a two button. When I click on the first button I want to display the image A and after 5 seconds change to image B. and when I click the second button I want to display the image B and after 5 seconds change to image A and this time 5 seconds are changed. A: You can achieve this by using setTimeout and clearTimeout in jQuery. You should have a function for changing the images. You can achieve this easily with the following jQuery code. $(document).ready(function(){ var time = 0; $('#img').attr('src','image_path'); function change(){ $('#img').attr('src','new_image_path'); time = time+100; if(time>2000){ time=0; } setTimeout(change, time); } change(); }); Q: Is there a shorter, single line alternative for Rails' method_missing? I've got a set of methods that will often be called, but don't respond to anything. Instead of hard-coding the call to method_missing, I'd like to use a single line if possible. Current: method_missing :foo How can I do this in a single line: method_missing ::foo A: Check out method_missing in the Ruby documentation. This has changed in the last few versions of ruby and may be the reason why you have to use the :method_missing method.
