. . . If there is another better approach, please explain. A: I solved it that way: `def f(): file_in = File(r'C:\Users\mike\Desktop\celegido\2015-05-12\1') file_out = open(r"C:\Users\mike\Desktop\celegido\2015-05-12\2", "w") for filename in file_in.glob('*.txt'): file_out.write(filename) file_out.write(' ') file_out.close() for file in os.listdir("C:\\Users\\mike\\Desktop\\celegido\\2015-05-12\\*"): if "*.txt" in file: f()` Works fine. Thanks a lot for your time and help! Best regards, Mike Q: Storing JSON data in MySQL database I'd like to save information I get from a remote server, in a MySQL database, in JSON format. I'm trying to figure out the best way to do this. Maybe I need to use `JSON_SET` or `JSON_INSERT`, but I can't seem to find out how to do it. From the JSON data, I'd need to save information such as the customer id (the integer), the product id (the integer), the product code (the string), the price (the number), the stock (the string), the discount (the integer). The information coming from the remote server needs to be as up to date as possible, as every minute there are a few new new orders. I only want to save the information in the database for the next few minutes. I need a way to check if the data in the database has changed, so the order can be updated and I can update the database with the new information. Is it best to save this information as a string in the database? Or should I save it as an object and save an id for the object which is a unique identifier for the object? How would I
